

Bippo Lingo

TAKING PICTURES: X-rays are needed to see decay in between your child's teeth. Dr. Brasher recommends taking pictures every 6 month.

VITAMINS: Fluoride treatment we place on the teeth to strengthen them to fight decay.

COUNTING YOUR TEETH: The exam Dr. Brasher does to check for decay, alignment, or any problems with your child's oral health.

SUGAR BUGS: Decay in the tooth which requires removal. Decay is the breakdown of the hard enamel and dentin of the tooth from bacteria. This may be caused from improper brushing habits or a diet that includes a lot of sugar or starches.

PUSH: Our anesthesia used to numb your child's tooth. We never use words like shot or needle.

SLEEPY JUICE: Topical placed around the tooth before anesthesia is used.

RAINCOAT: A rubber dam that isolates the tooth we are working on, keeping it dry.

TOOTH WASHER: Our highspeed dental handpiece that whistles real loud and blows all the sugar bugs out of their teeth.

MR. THIRSTY: Our suction that drinks up all of the water.

TOOTH RING: A small clamp that hugs the tooth.

MOUTH RESTER: An instrument used to safely hold a child's mouth open. This keeps us from losing any fingers.
